Event Management System - Execution Process

This document outlines the steps required to execute and run the Event Management System project on your local machine.

Prerequisites

Before you begin, ensure you have the following installed on your system:

- **Python 3.x** (preferably 3.8 or higher)
- **pip** (Python package installer)

Step-by-Step Execution Guide

Step 1: Navigate to the Project Directory

Open your terminal or command prompt (such as PowerShell or CMD) and navigate to the main project directory where `manage.py` is located.

```
```bash
cd d:\event\event\event_management
```
```

Step 2: Activate the Virtual Environment

Activate the pre-configured Python virtual environment to ensure all dependencies run in isolation.

For **Windows**:

```
```bash
env\Scripts\activate
```
```

(Note: If the environment name is `venv`, use `venv\Scripts\activate` instead)

Step 3: Install Dependencies

If you have not already installed the required packages, navigate one folder up or point `pip` to the `requirements.txt` file located in `d:\event\event`:

```
```bash
pip install -r ../requirements.txt
```
```

Step 4: Apply Database Migrations

Ensure your database is set up with all the necessary tables.

```
```bash
python manage.py makemigrations
python manage.py migrate
```
```

Step 5: Train Machine Learning Models (Optional/If Required)

If you need to re-train the AI event planner models, open a terminal in `d:\event\event` and execute:

```
```bash
cd d:\event\event
python train_models.py
```
```

Step 6: Start the Development Server

With the environment activated and your console inside the `event\_management` directory, start the Django local server:

```
```bash
python manage.py runserver
```
```

Step 7: Access the Application

Open your web browser and navigate to:

```
```
http://127.0.0.1:8000/
```
```

Admin Access

To access the Django Administration Dashboard, go to:

```
'''
```

```
http://127.0.0.1:8000/admin/
```

```
'''
```

If you need to create a new superuser account, use the following command:

```
```bash
```

```
python manage.py createsuperuser
```

```
'''
```

```

```

**\*\*Note:\*\*** Always remember to keep your virtual environment activated when working on or running the project.
